Presented to:

JOHN PAUL SORIANO

Developer

March 2026

I. Application Background

Expense Diary: Expense Tracker is a mobile application designed to help users record daily expenses, organize them by category, and review financial summaries and insights. The application also provides reminder notifications to encourage consistent expense tracking.

II. Test Environment

App Version: 1.0.0

Target Platform: Android 7.0 and above

Test Device: Xiaomi 14T

OS Version: Android 14

III. Test Scope

The testing focuses on evaluating the core functionalities and overall usability of the application. The scope includes validation of user inputs, particularly edge cases and malformed data, as well as verification of data integrity and accuracy of recorded financial information.

The assessment also covers user interface (UI) layout, responsiveness, and visual consistency across different screens, along with user experience (UX) and interaction flow during common user actions. Navigation behavior between tabs and components is evaluated to ensure consistency.

Additionally, the testing examines data handling mechanisms, including filtering logic and consistency between data input and data viewing. Settings functionality and system feedback behavior are also reviewed. Basic security considerations related to input handling and potential vulnerabilities are included within the scope.

IV. Test Methodology

Manual testing was conducted using real-user scenarios and edge case inputs. The objective is to identify functional issues, usability concerns, and potential risks.

To ensure clear communication regarding the bugs found, the following classifications and statuses are used to document the results:

Level	Name	Description
1	Critical	App unusable, crashes, or exposes sensitive data
2	High	Major feature broken
3	Medium	Usability or logic issue
4	Low	Minor UI issue

Table 1: Severity Classification

V. Executive Summary

During the manual testing phase, a total of 18 issues were identified. The breakdown of issues based on severity classification is as follows:

- **Critical: 3**
- **High: 4**
- **Medium: 11**
- **Low: 0**

The findings indicate that while the application's core features are functional, several issues affect data integrity, input validation, and user interface behavior. Critical and high-severity issues were primarily related to improper handling of numeric inputs and invalid values, which may lead to inaccurate financial data.

Additionally, inconsistencies in date handling and UI interactions impact usability and overall user experience. Addressing these issues will improve system reliability, data accuracy, and user confidence in the application.

VI. Test Artifacts and Evidence

All supporting materials, including screenshots and screen recordings for each documented issue, are stored in the following repository:

Google Drive Link:

https://drive.google.com/drive/folders/1LCeQZ21IAncHCsmsYVjlmuf-2m35bCe4?usp=drive_link

The files are organized based on their respective Issue IDs and follow a naming convention for easy identification and verification.

Access permissions are configured to allow viewing for anyone with the link to ensure accessibility during review.

VII. Issue Log

Category: Navigation

Issue ID: NAV-001 | Severity: Medium

Title: Inconsistent Back Navigation Icon Across Tabs

Description: The application displays inconsistent navigation pattern across different tabs, leading to a lack of uniform navigation behavior.

Steps to Reproduce:

1. Open the app.
2. Navigate to different tabs (Summary and Spending Insights)
3. Observe the top-left navigation icon

Expected Result: All tabs should follow a consistent navigation pattern. Either using a back button or a hamburger menu uniformly, depending on the app's navigation design.

Actual Result: The Summary tab displays a hamburger menu, while Spending Insights tab show a back button.

Impact: May confuse users and create inconsistency in navigation experience.

Recommendation: Standardize the navigation process across the entire application to ensure a consistent user experience.

https://drive.google.com/file/d/1zP81H7dVbDciKxyz4YbvsKmWPXYtI-b9/view?usp=drive_link

Category: Settings

Issue ID: SET-001 | **Severity:** Medium

Title: Settings Tab Disappears After Selection

Description: When accessing the settings tab (currency selection), the currency options become hidden after selection. This results in a lack of visible confirmation for the user.

Steps to Reproduce:

1. Open the application
2. Navigate to Settings
3. Select a currency option
4. Observe the Settings tab behavior

Expected Result: The Settings tab should remain visible or provide clear feedback indicating the selected option.

Actual Result: The Settings tab disappears after interaction, reducing visibility and feedback.

Impact: Users may become unsure if their selection was applied, leading to repeated actions.

Recommendation: Keep the Settings tab visible after selection of currency or provide a clear confirmation indicator.

Video Reference:

https://drive.google.com/file/d/1CHQGOeZLNfsDegwLQh9iv5-o2rOkHhJS/view?usp=drive_link

Category: Security

Issue ID: SEC-001 | **Severity:** Critical

Title: No User Login or Authentication Mechanism

Description: The application does not implement any form of user authentication (login or account system), which may expose sensitive financial data.

Steps to Reproduce:

1. Install and open the application
2. Observe access to features without authentication

Expected Result: Users should be required to create an account to log in or authenticate before accessing sensitive financial data.

Actual Result: All data is accessible without any authentication.

Impact: This introduces risks such as exposure of sensitive financial information, unauthorized access, and potential misuse of user data.

Recommendation: Implement a secure authentication mechanism such as email/password login, biometric authentication, or PIN protection.

Category: UI/UX

Issue ID: UI-001 | **Severity:** Medium

Title: Currency Icon Mismatch in Amount Input Field

Description: The amount input field displays a dollar sign (\$) icon regardless of the selected currency. Although the selected currency is shown elsewhere, the icon may create confusion for users.

Steps to Reproduce:

1. Open the application
2. Navigate to the "+ Expense" tab
3. Observe the icon in the amount input field
4. Change currency in Settings (e.g., PHP, Yen)
5. Return to the "+ Expense" tab

6. Observe the icon in the amount input field

Expected Result: The currency icon should dynamically match the selected currency or use a neutral money symbol.

Actual Result: The dollar sign (\$) besides the input box remains displayed even when a different currency is selected.

Impact: May confuse users and lead to incorrect assumptions during data entry.

Recommendation: Update the icon dynamically based on selected currency or replace it with a neutral symbol.

Issue ID: UI-002 | **Severity:** Medium

Title: Missing Confirmation Button in Date Selection

Description: The date range selection interface does not provide a confirmation (OK/Apply) button. Only a cancel option is visible, and the interaction flow is unclear after selection.

Steps to Reproduce:

1. Open the application
2. Navigate to Dashboard
3. Click Date button → In Quick range presets, choose any option
4. Observe

Expected Result: A confirmation button (OK/Apply) should be present, and the selection should only apply after confirmation.

Actual Result: Only a cancel option is visible, and the behavior after selection is unclear.

Impact: Users may be unsure if their selected date range has been applied.

Recommendation: Add a confirmation button and maintain consistent interaction behavior.

Issue ID: UI-003 | **Severity:** Medium

Title: Inefficient Date Selection in Dashboard Due to Lack of Direct Month/Year Navigation

Description: In the Dashboard's filter expenses container, users are provided with options to filter by month, year, or date. When using the Date option, particularly the custom range feature, users are required to manually scroll through the calendar to access previous months or years. Unlike the date selection in the "+ Expense" tab, which provides easier access to month and year navigation, the Dashboard lacks a similar mechanism, making the process inconsistent and inefficient.

Steps to Reproduce:

1. Open the application
2. Navigate to Dashboard
3. Select the Date filter option
4. Choose Custom Range
5. Attempt to select a date from a previous year

Expected Result: Users should be able to quickly access and select a specific month or year through a direct navigation feature such as a dropdown, calendar header selector, or similar control, consistent with the date selection experience in the "+ Expense" tab.

Actual Result: Users must continuously scroll backward from the current date to reach previous months or years, resulting in a time-consuming and inconsistent interaction compared to other parts of the application.

Impact: This reduces usability and efficiency, especially when selecting dates far in the past, and creates inconsistency in user experience across different parts of the application.

Recommendation: Implement a direct month and year selection feature, such as a dropdown or calendar navigation control, and align the Dashboard date selection behavior with the more efficient implementation used in the "+ Expense" tab.

Issue ID: UI-004 | **Severity:** Medium

Title: Large Amount Input Causes Layout Break, Title Disappearance, and Date Misalignment in Summary

Description:

When a very large numeric value is entered in the amount field (e.g., 15 or more digits), the Summary layout becomes unstable. The amount text occupies excessive space within the container, causing other elements such as the title and date to become misaligned, truncated, or completely invisible. In addition, large numeric inputs are not stored accurately, as values beyond a certain length are rounded or altered when displayed.

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Enter a large numeric value (e.g., 12345678901234567) in the amount field

4. Enter any title
5. Save the expense
6. Navigate to Summary tab
7. Observe the layout and displayed values

Expected Result: The system should handle large numeric inputs properly by either restricting them or storing them accurately without modification. The layout should remain stable regardless of input size, and all elements such as the title and date should remain visible and properly aligned without overlapping or overflowing outside the container.

Actual Result: Large numeric values are altered (e.g., 12345678901234567 becomes 12345678901234568.00), indicating a loss of precision. The amount text overflows and dominates the container, causing the title to become partially or completely invisible, while the date becomes vertically stacked or misaligned. The overall layout breaks due to improper handling of large values.

Impact: This issue affects both data integrity and user interface reliability. Incorrect financial values may be recorded, and the layout becomes difficult to read and interpret. This may reduce user trust in the accuracy of the application.

Recommendation: The application should enforce a reasonable limit on numeric input length and use appropriate data types to prevent precision loss. Input validation should be implemented to avoid overflow, and layout constraints such as proper text wrapping, truncation, and container limits should be applied to maintain a stable and readable interface.

Issue ID: UI-005 | **Severity:** Medium

Title: Keyboard Interaction Causes Scroll Overflow and Unintended Reopening During Category Selection

Description: When the on-screen keyboard is active in the "+ Expense" tab, the interface allows users to scroll beyond the intended layout bounds, creating excessive empty space below the content. The screen can extend to approximately half of the display height beyond the normal limit. Furthermore, after entering data and selecting a category, the keyboard automatically reappears even when no text field is selected, allowing the scroll overflow issue to be triggered repeatedly.

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Tap on either the Title or Amount textbox to open the keyboard
4. Scroll downward and observe the extended scroll area
5. Hide the keyboard (optional)
6. Select a category from the category list
7. Observe that the keyboard reappears
8. Scroll again and observe the overflow behavior

Expected Result: The interface should restrict scrolling within the intended layout boundaries even when the keyboard is active. The layout should properly adjust to the presence of the keyboard without introducing unnecessary empty space. The keyboard should only appear when a user explicitly selects a text input field.

Actual Result: Users are able to scroll beyond the intended layout area when the keyboard is active, resulting in excessive empty space. After selecting a category, the keyboard reappears unexpectedly, even without user interaction with a text field, allowing the issue to occur repeatedly.

Impact: This behavior creates an unpolished and confusing user experience. It disrupts normal interaction flow and may reduce usability, especially for users who rely on predictable interface behavior.

Recommendation: The application should implement proper keyboard-aware layout handling to ensure the interface resizes correctly when the keyboard is active. Scrolling should be constrained dynamically, and keyboard visibility should be controlled based on user interaction to prevent unintended reopening.

Category: Input Validation

Issue ID: INP-001 | **Severity:** High

Title: Excessive Input Length Allowed in Amount Field

Description: The amount input field allows extremely large numeric values (up to 16,384 visible digits), which exceeds practical usage.

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Enter a very large number (e.g., 16,000+ digits)

Expected Result: Input should be limited to a reasonable numeric range.

Actual Result: The application accepts extremely large values without restriction.

Impact: May cause data inaccuracies and potential system instability.

Recommendation: Implement maximum input length and value validation.

Video Reference:

https://drive.google.com/file/d/1s9DGX0BXaqmpKlKt2-u1Jwz9JKijcnfZ/view?usp=drive_link

Issue ID: INP-002 | **Severity:** Medium

Title: Input Overflow Causes Invisible Characters

Description: When the input exceeds the visible capacity of the field, additional digits become invisible (transparent).

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Enter a long numeric value
4. Continue typing beyond visible limit

Expected Result: Input should remain visible (scrollable) or be restricted.

Actual Result: Additional digits become invisible.

Impact: Leads to inaccurate data entry and poor user experience.

Recommendation: Implement input limits and proper field handling (scrolling or truncation).

Video Reference:

https://drive.google.com/file/d/1e4CXSZeRQ5IKS02SPnZU4m0HesSdTM7K/view?usp=drive_link

Issue ID: INP-003 | **Severity:** High

Title: Scientific Notation (E Notation) Accepted as Valid Amount Input

Description: The application accepts numeric values in scientific notation (e.g., 1e10) as valid input in the amount field. The value is recorded and displayed as-is across the system.

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Paste or input a value using scientific notation (e.g., 1e10)
4. Save the expense
5. Navigate to Dashboard or Summary

Expected Result: The system should either convert large scientific notation into a standard numeric format, or reject it as invalid input

Actual Result: The system accepts and records the value in scientific notation format.

Impact: May lead to inconsistent data representation and confusion in financial records.

Recommendation: Validate and restrict input format to standard numeric values only, or automatically convert scientific notation into a readable numeric format.

Video Reference:

https://drive.google.com/file/d/1hzhb-2ODxFQ69IPRTvXPCumwdgic0Fqu/view?usp=drive_link

Issue ID: INP-004 | **Severity:** Critical

Title: NaN (Not-a-Number) Accepted as Valid Amount Input

Description: The application accepts NaN (Not-a-Number) as a valid input in the amount field and records it across the system.

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Paste NaN into the amount field
4. Save the expense
5. Navigate to Dashboard or Summary

Expected Result: The system should reject invalid numeric inputs such as NaN.

Actual Result: The system accepts and records NaN as a valid value.

Impact: Breaks data integrity and may cause calculation errors or system instability in summaries and analytics.

Recommendation: Implement strict numeric validation to reject non-numeric values such as NaN.

Video Reference:

https://drive.google.com/file/d/1wEGYPJH9lwcvBt-MNVyHUhuSxeJQa_iz/view?usp=drive_link

Issue ID: INP-005 | **Severity:** Medium

Title: Invisible Characters Allowed in Title Field

Description: The title input field allows insertion of invisible or non-printable characters, resulting in records that appear blank or have no visible title.

Steps to Reproduce:

1. Open the application
2. Navigate to "+ Expense" tab
3. Paste invisible or non-printable characters into the title field
4. Save the expense
5. Observe the recorded entry

Expected Result: The system should either prevent invisible/non-printable characters, or require at least one visible character

Actual Result: The system accepts invisible characters, resulting in blank or unreadable titles.

Impact: Reduces data clarity and makes records difficult to identify or manage.

Recommendation: Implement input validation to restrict non-printable characters and require visible text input.

https://drive.google.com/file/d/1RZ5xaQiGmRoxGACmkID5i1wE9v0SP03I/view?usp=drive_link

Category: Data Integrity

Issue ID: DATA-001 | **Severity:** High

Title: Incorrect Currency Conversion of Existing Records

Description: Previously recorded expenses automatically change currency symbols when the user switches currency settings without converting actual values.

Steps to Reproduce:

1. Add an expense using one currency (e.g., \$30)
2. Change currency in Settings
3. Navigate to Dashboard or Summary

Expected Result: Values should either be converted correctly or retain original currency.

Actual Result: Only the currency symbol changes while the value remains the same.

Impact: Leads to incorrect financial interpretation and misleading records.

Recommendation: Implement proper currency conversion or preserve original currency per entry.

Video Reference:

https://drive.google.com/file/d/1TtnUkhobHkn3uTe7EeUYvPeVpqdB8_WS/view?usp=drive_link

Issue ID: DATA-002 | **Severity:** Critical

Title: Large Numeric Input Stored as Infinity

Description: When extremely large values are entered in the amount field, the system records them as “Infinity” in the Dashboard, Top Spending Categories, and Summary sections.

Steps to Reproduce:

1. Open the application

2. Navigate to "+ Expense" tab
3. Enter an extremely large number
4. Save the expense
5. Navigate to Dashboard or Summary

Expected Result: The system should either reject invalid values or store them correctly within defined limits.

Actual Result: The value is recorded and displayed as "Infinity."

Impact: Breaks data accuracy and compromises reliability of financial records.

Recommendation: Validate input limits and prevent overflow errors during data processing.

Video Reference:

https://drive.google.com/file/d/1fCbZHQMrSlfQKz5VaiYot40Mnm7Wg6ky/view?usp=drive_link

Category: Functional

Issue ID: FUNC-001 | **Severity:** Medium

Title: Missing Tutorial or Onboarding Guide

Description: The application does not provide any onboarding or tutorial for first-time users.

Steps to Reproduce:

1. Install and open the application

Expected Result: A tutorial or onboarding guide should be available.

Actual Result: No guidance is provided.

Impact: Users may struggle to understand app features.

Recommendation: Implement onboarding or a help section.

Issue ID: FUNC-002 | **Severity:** High

Title: Missing Reminder Notification Feature

Description: The application claims to provide reminder notifications, but no such feature is available.

Steps to Reproduce:

1. Install and open the application
2. Explore all features

Expected Result: Reminder notifications should be present.

Actual Result: No notification feature exists.

Impact: Mismatch between advertised and actual functionality reduces user trust.

Recommendation: Implement reminder notifications with customizable settings.

Issue ID: FUNC-003 | **Severity:** Medium

Title: Inconsistent and Invalid Date Range Availability Across Dashboard Filters and Expense Input

Description: In the Dashboard, the filter expenses container provides options to filter by month, year, and date. However, these filters allow users to select date ranges that are not logically valid within the system. For example, users can view records from 2016 up to 2027 across the month, year, and custom date range filters, even though the application only supports adding expense data from the current date up to one year ago. This results in a mismatch between available filter ranges and actual data input limitations.

Steps to Reproduce:

1. Open the application

2. Navigate to Dashboard
3. Use the Month filter and scroll through available months
4. Observe that months beyond realistic data range (e.g., future dates like 2027) are selectable
5. Use the Year filter and observe selectable years (e.g., 2016–2027)
6. Use the Date filter → Custom Range
7. Attempt to select dates far in the past or future
8. Navigate to "+ Expense" tab
9. Attempt to input a date outside the allowed one-year range

Expected Result: Date filters should only allow selection within the valid and supported data range of the application. The available date range for viewing and filtering should be consistent with the allowed input range, ensuring logical and predictable behavior.

Actual Result: The Dashboard allows selection of dates far beyond the supported input range, including past and future dates where no data can exist. Meanwhile, the "+ Expense" tab restricts input to within one year from the current date, creating inconsistency between viewing and data entry.

Impact: This inconsistency may confuse users and create misleading expectations about available data. Users may assume that the system supports historical or future records beyond its actual limitations, reducing clarity and reliability of the application.

Recommendation: Align the date range constraints across all features of the application. The Dashboard filters should be restricted to valid and supported date ranges, consistent with the input limitations in the "+ Expense" tab, or the system should be enhanced to support extended date ranges if intended.
